Cover Story—Environmental Remediation
Ecological Restoration with Native Grasses and Forbs:
The Fernald Preserve and Weldon Spring Restoration Projects 12
Native grasses and forbs are an extremely effective, low-maintenance erosion control. Reestablishing a landscape that once existed prior to European settlement not only ensures an environmentally ethical treatment of the land, but also provides additional opportunities for beneficial community reuse.

Other Features
Summertime Forecast: Major Upgrades and Process Improvements at Hanford’s ERDF 19
Hanford’s ERDF currently contains nearly 7.5 million tons of waste and will have a capacity of 11 million tons when the current expansion is completed in early 2009.

Thoughts on Spent Fuel Storage 26
Comments by U.S. Nuclear Regulatory Commissioner Gregory Jaczko.

New Era of Salt Waste Processing Begins at SRS 28
Through new technology and innovative ideas, the SRS is proactively moving from an era of salt waste storage to one of long-term, high-volume salt waste disposition.

CH2M Hill Turns Safety Around at Hanford 32
In 1999, when CH2M Hill Hanford Group began working at the Hanford Site to safely manage 53 million gallons of radioactive and chemical waste, it inherited a safety program in need of a major overhaul. Today, in sharp contrast, it can boast of having one of the best safety records in the DOE complex for companies doing similar types of work.

SRS’s P Area Closure Work Reaches Milestones: Area Cold and Dark, Moderator Removed, Demolition Complete 40
The Savannah River Site’s P Area has a history of leading the way at the DOE site. As the first reactor area at SRS to undergo area closure, it’s still doing so.

Using Mixed Bed Ion Exchange Resins in the MARS Nuclear Power Plant 45
The need for an alternative deboration process that can increase the length of the fuel cycle and/or reduce the workload on the radwaste systems is crucial. But the MARS philosophy is stringent: the alternative has to be effective, simple, and cheap.
