Preface xiii

Preface to the 2000 Printing xvi

1 Introduction 1
- 1.1 Historical Roots 2
  - 1.1.1 The Early Years 2
  - 1.1.2 The Origins of Modern Shielding Practice 4
  - 1.1.3 Modern Developments 4
  - 1.1.4 Regulatory Development 6
- 1.2 Radiation Shielding Institutions 7
  - 1.2.1 Professional Societies and Journals 8
- 1.3 Radiation Protection Institutions 8
  - 1.3.1 United Nations Organizations 9
  - 1.3.2 Governmental Organizations in the United States 9
- 1.4 Important Sources of Shielding Information 10
- 1.5 Final Remarks 12

2 Characterization of Radiation Fields and Sources 15
- 2.1 Directions and Solid Angles 16
- 2.2 Fundamental Radiation Field Variables 17
  - 2.2.1 Fluence and Fluence Rate 17
  - 2.2.2 Net Flow and Net Flow Rate 18
  - 2.2.3 Other Definitions 19
- 2.3 Directional Properties of the Radiation Field 19
  - 2.3.1 Properties of the Fluence 19
  - 2.3.2 Transformation of Variables 20
  - 2.3.3 Angular Properties of the Flow and Flow Rate 21
- 2.4 Representations of Angular Dependence 22
- 2.5 General Specification of Radiation Sources 23
- 2.6 Distributed and Discrete Variables 25

3 Interaction of Radiation with Matter **28**
3.1 Interaction Coefficient 28
3.2 Microscopic Cross Section 30
3.3 Conservation Laws for Scattering Reactions 31
3.3.1 Conservation of Momentum 31
3.3.2 Conservation of Energy 32
3.3.3 Application of the Conservation Laws 33
3.3.4 Scattering of Photons by Free Electrons 33
3.3.5 Scattering of Neutrons by Atomic Nuclei 34
3.3.6 Limiting Cases in Classical Mechanics of Elastic Scattering 38
3.3.7 Elastic Scattering of Electrons and Heavy Charged Particles 39
3.4 Cross Sections for Photon Interactions 39
3.4.1 Thomson Cross Section for Incoherent Scattering 40
3.4.2 Klein-Nishina Cross Section for Incoherent Scattering 40
3.4.3 Incoherent Scattering Cross Sections for Bound Electrons 41
3.4.4 Coherent (Rayleigh) Scattering 42
3.4.5 Photoelectric Effect 44
3.4.6 Pair Production 45
3.4.7 Photon Attenuation Coefficients 45
3.4.8 Compton Absorption and Scattering Cross Sections 46
3.4.9 Photoelectric Absorption Cross Section 47
3.4.10 Absorption Cross Section for Pair Production 48
3.4.11 Corrections for Radiative Energy Loss 48
3.5 Neutron Interactions 49
3.5.1 Classification of Types of Interactions 50
3.5.2 Cross Sections for Neutron Scattering 56
3.5.3 Average Energy Transfer in Neutron Scattering 58
3.5.4 Radiative Capture of Neutrons 60
3.6 Charged-Particle Interactions 61
3.6.1 Collisional Energy Loss 62
3.6.2 Electron Radiative Energy Loss 67
3.6.3 Charged-Particle Range 69
3.6.4 Residual-Range Concept 72
3.6.5 Electron Radiation Yield 72

4 Common Radiation Sources Encountered in Shield Design **80**
4.1 Neutron Sources 80
4.1.1 Fission Neutrons 80
4.1.2 Photoneutrons 84
4.1.3 Neutrons from (α, n) Reactions 86
4.1.4 Activation Neutrons 91
4.1.5 Fusion Neutrons 92
4.2 Sources of Gamma Photons 92
4.2.1 Radioactive Sources 92

4.2.2 Prompt Fission Gamma Photons 93
4.2.3 Gamma Photons from Fission Products 94
4.2.4 Capture Gamma Photons 101
4.2.5 Gamma Photons from Inelastic Neutron Scattering 103
4.2.6 Activation Gamma Photons 103
4.2.7 Annihilation Radiation 104
4.3 Sources of X Rays 105
4.3.1 Characteristic X Rays 105
4.3.2 Bremsstrahlung 108
4.3.3 X-Ray Machines 111

5 Photon and Neutron Response Functions 121
5.1 Dosimetric Quantities 121
5.1.1 Energy Imparted, Specific Energy, and Lineal Energy 123
5.1.2 Deterministic Quantities 123
5.1.3 Absorbed Dose 124
5.1.4 Kerma 124
5.1.5 Exposure 124
5.1.6 Linear Energy Transfer 125
5.2 Dose Equivalent Quantities 126
5.2.1 Quality Factor 126
5.3 Concept of Radiation Response Function 129
5.4 Local Response Functions for Point Targets 130
5.5 Charged-Particle Equilibrium 131
5.6 Local Response Functions for Neutrons 134
5.7 Local Response Functions for Photons 137
5.7.1 Photon Energy Deposition Coefficients 137
5.7.2 Photon Kerma, Absorbed Dose, and Dose Equivalent 139
5.7.3 Photon Exposure 141
5.7.4 Selection of Proper Mass Energy Deposition Coefficients 141
5.8 Response Functions for the Human as Target 144
5.8.1 Characterization of Ambient Radiation 144
5.8.2 Response Functions Based on Simple Geometric Phantoms 145
5.8.3 Response Functions Based on Anthropomorphic Phantoms 147
5.8.4 Comparison of Response Functions 149

6 Basic Methods for Radiation Dose Calculations 155
6.1 Uncollided Radiation 156
6.1.1 Exponential Attenuations 156
6.1.2 Mean-Free-Path Length 157
6.1.3 Uncollided Dose from a Point Source 157
6.1.4 Point Kernel for the Uncollided Dose 160
6.2 Uncollided Doses from Distributed Sources 161
6.2.1 Line Source 161

6.2.2 Disk Source 164
6.2.3 Rectangular Area Source 167
6.2.4 Spherical Surface Source 169
6.2.5 Frustrum of a Cone 169
6.2.6 Infinite Slab Source 170
6.2.7 Cylindrical Volume Source 171
6.3 Point-Kernel Concept for Total Dose 173
6.3.1 Dose in Terms of the Green's Function of Transport Theory 173
6.3.2 Point Kernel for the Total Dose 174
6.3.3 Isotropic Detector Without Spatial Dependence 175
6.3.4 Infinite Homogeneous Medium 175
6.3.5 Examples of Point Kernels 176
6.4 Generalized Method for an Infinite Homogeneous Medium 177
6.4.1 Volumetric Sources 178
6.4.2 Absorbed Fraction and Reduction Factor 180
6.4.3 Advantages of the Generalized Approach 181
6.4.4 Limiting Source or Target Volumes 182
6.4.5 Reciprocity Theorem 182
6.4.6 Extension to Nonuniform and Surface Sources 183
6.4.7 Infinite Cylindrical Sources 184
6.5 Calculation of Geometric Factors 185
6.5.1 Analytical Calculation of Geometry Factors 185
6.5.2 Examples of Geometry Factors and Point-Pair Distributions 185
6.5.3 Uncollided Dose Examples Using Geometry Factors 188
6.5.4 Monte Carlo Evaluation of Geometry Factors and Point-Pair Distance Distributions 189
6.5.5 Multiregion Geometries 191
6.5.6 Basic Geometry Factors for One-Dimensional Problems 192
6.5.7 Examples of Multiple Regions 193
6.6 Effect of Density Variations 195
6.6.1 Theorems for Density Variations 196
6.6.2 Point Kernels in Media with Density Variations 198
6.6.3 Modified Point-Pair Distance Distributions 199
6.6.4 Modified Geometry Factors 199
6.6.5 Example of a Modified Point-Pair Distance Distribution 200
6.6.6 Example Problem Using Modified Geometry Factors 200
6.7 Geometric Transformations 203
6.7.1 Circular Area (Disk)-to-Point Source Transformation 203
6.7.2 Volume-to-Surface Source Transformation 204

7 Special Techniques for Photons 214
7.1 Photon Buildup-Factor Concept 215
7.1.1 Isotropic, Monoenergetic Sources in Infinite Media 215
7.1.2 Comparison of Buildup Factors for Point and Plane Sources 218

7.1.3 Empirical Approximations for Point-Source Buildup Factors 220
7.1.4 Point-Kernel Applications of Buildup Factors 223
7.2 Buildup Factors for Heterogeneous Media 225
7.2.1 Boundary Effects in Finite Media 225
7.2.2 Treatment of Stratified Media 227
7.3 Broad-Beam Attenuation of Photons 229
7.3.1 Attenuation Factors for Monoenergetic Photon Beams 229
7.3.2 Attenuation of Oblique Beams of Monoenergetic Photons 231
7.3.3 Attenuation Factors for X-Ray Beams 231
7.3.4 The Half-Value Thickness 234
7.4 Photon Albedo Concept 235
7.4.1 Differential Number Albedo 236
7.4.2 Integrals of Albedo Functions 237
7.4.3 Application of the Albedo Method 237
7.4.4 Single-Scatter Albedo 239
7.4.5 Approximation for the Single-Scatter Dose Albedo 240
7.4.6 Chilton-Huddleston Formula 240
7.4.7 Photon Albedo Data 241
7.5 Photon Streaming Through Ducts 242
7.5.1 Characterization of Incident Radiation 244
7.5.2 Line-of-Sight Component for Straight Ducts 245
7.5.3 Wall-Penetration Component for Straight Ducts 248
7.5.4 Single-Scatter Wall-Reflection Component 248
7.5.5 Transmission of Gamma Rays Through Two-Legged Rectangular Ducts 250
7.6 Shield Heterogeneities 252
7.6.1 Limiting Case for Small Discontinuities 253
7.6.2 Small Randomly Distributed Discontinuities 253
7.6.3 Large Well-Defined Heterogeneities 255
7.7 Gamma-Ray Skyshine 256
7.7.1 Open Silo Example 257
7.7.2 Shielded Skyshine Sources 259

8 Special Techniques for Neutrons 269
8.1 Differences Between Neutron and Photon Calculations 271
8.1.1 Buildup Factors 271
8.1.2 Neutron Dose Units 272
8.2 Fission Neutron Attenuation by Hydrogen 273
8.3 Removal Cross Sections 279
8.3.1 Extensions of the Removal-Cross-Section Model 282
8.4 Fast-Neutron Attenuation Without Hydrogen 288
8.5 Calculation of the Intermediate and Thermal Fluences 291
8.5.1 Diffusion Theory for Thermal Neutron Calculations 291

8.5.2 Fermi Age Treatment for Thermal and Intermediate-Energy Neutrons 293
8.5.3 Removal-Diffusion Techniques 295
8.6 Capture-Gamma-Photon Attenuation 300
8.6.1 Response from Uncollided Photons 303
8.6.2 Response from Scattered Photons 304
8.7 Neutron Shielding with Concrete 304
8.7.1 Concrete Slab Shields 307
8.8 Neutron Albedo 312
8.8.1 Fast Neutron Albedo 312
8.8.2 Intermediate-Energy Neutron Albedo 315
8.8.3 Thermal Neutron Albedo 317
8.8.4 Emission of Secondary Photons During Neutron Reflection 317
8.9 Duct Streaming for Neutrons 318
8.9.1 Straight Ducts 318
8.9.2 Ducts with Bends 320
8.9.3 Empirical and Experimental Results 322
8.10 Neutron Skyshine 322

9 Special Techniques for Charged Particles 333
9.1 Introduction 333
9.2 Alpha and Beta Decay 333
9.2.1 Alpha Decay 333
9.2.2 Beta Decay 334
9.3 Spatial Distribution of the Absorbed Dose 336
9.3.1 Point and Plane Kernels Defined 336
9.3.2 Electron and Beta-Particle Dose Distributions 338
9.4 Applications of the Point-Kernel 342
9.4.1 Line Source of Electrons 342
9.4.2 Plane Isotropic Source of Electrons 344
9.4.3 Volume Source of Electrons 347
9.5 Energy Spectrum of the Fluence 348
9.5.1 CSDA Approximation 349
9.5.2 Fluence Energy Spectra for Electron Sources 349

10 Deterministic Transport Theory 355
10.1 Transport Equation 355
10.1.1 Explicit Form for the Three Basic Geometries 359
10.1.2 Integral Form of the Transport Equation 361
10.1.3 Transport Equation for Photons 365
10.1.4 Transport Equation for Neutrons 368
10.2 Implications of the Transport Equation 371
10.2.1 Existence and Uniqueness 371
10.2.2 Spatially Uniform Flux Density 371

10.2.3 Plane-Density Variations 372
10.2.4 Scaling of Radiation Fields 374
10.2.5 Volume-to-Surface Source Transformation 375
10.3 Approximations to the Transport Equation 377
10.3.1 Exponential Attenuation 378
10.3.2 Diffusion Approximation 380
10.3.3 Multigroup Approximation 384
10.4 Method of Moments 386
10.5 Discrete-Ordinates Method 392
10.6 Integral Transport Method 398
10.6.1 Direct Integration of the Scattering Source Term 400
10.6.2 Implementation 402

11 Monte Carlo Methods for Radiation Transport Calculations 408
11.1 Random and Pseudorandom Numbers 409
11.2 Selection Techniques for Stochastic Variables 411
11.2.1 Selection of Discrete Variables 411
11.2.2 Cumulative Distribution Method for Continuous Variables 412
11.2.3 Rejection Method 413
11.2.4 Composition Method 414
11.2.5 Composition-Rejection Method 415
11.3 Simple Analog Monte Carlo Calculation 415
11.3.1 Geometric Transformations 415
11.3.2 Particle Tracking 416
11.3.3 Scoring 419
11.4 Variance Reduction and Nonanalog Methods 420
11.4.1 Central-Limit Theorem 421
11.4.2 Importance Sampling 421
11.4.3 Truncation Methods 423
11.4.4 Splitting and Russian Roulette 424
11.4.5 Interaction Forcing 424
11.4.6 Exponential Transformation 424
11.4.7 Deterministic Scoring Methods 425

Appendix A: Constants and Conversion Factors 431

Appendix B: Mathematical Tidbits 433
B.1 Elliptic Integrals 433
B.2 Sievert or Secant Integral 433
B.3 Exponential Integral Function 435
B.4 Legendre Polynomials 440
B.5 Chandrasekhar's H Function 442
B.6 Dirac Delta Function 443

Appendix C: Cross Sections and Related Data 446

Appendix D: Photon and Neutron Response Functions 468

Appendix E: Photon Buildup and Neutron Attenuation Factors 478

Appendix F: Skyshine Response Functions 498

Appendix G: Fission-Product Source Parameters 506

Appendix H: Photons Emitted by Selected Radionuclides 514
